# What's the current situation?

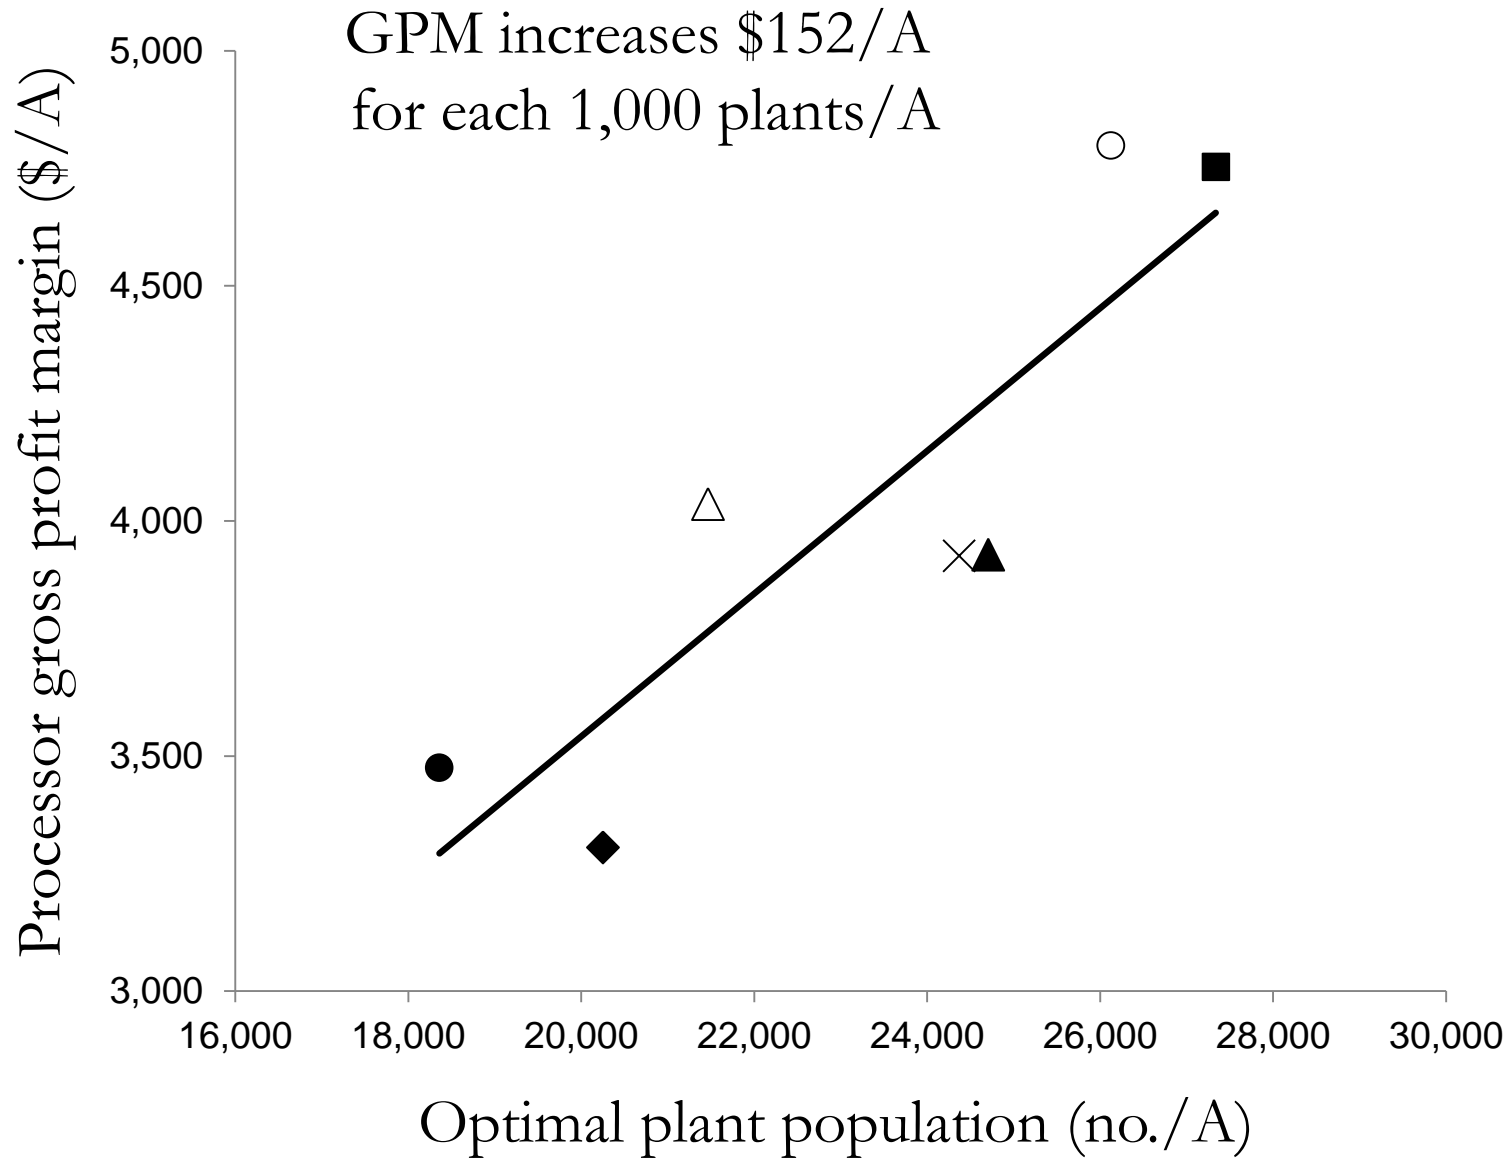

## Example of a top-performing hybrid

---

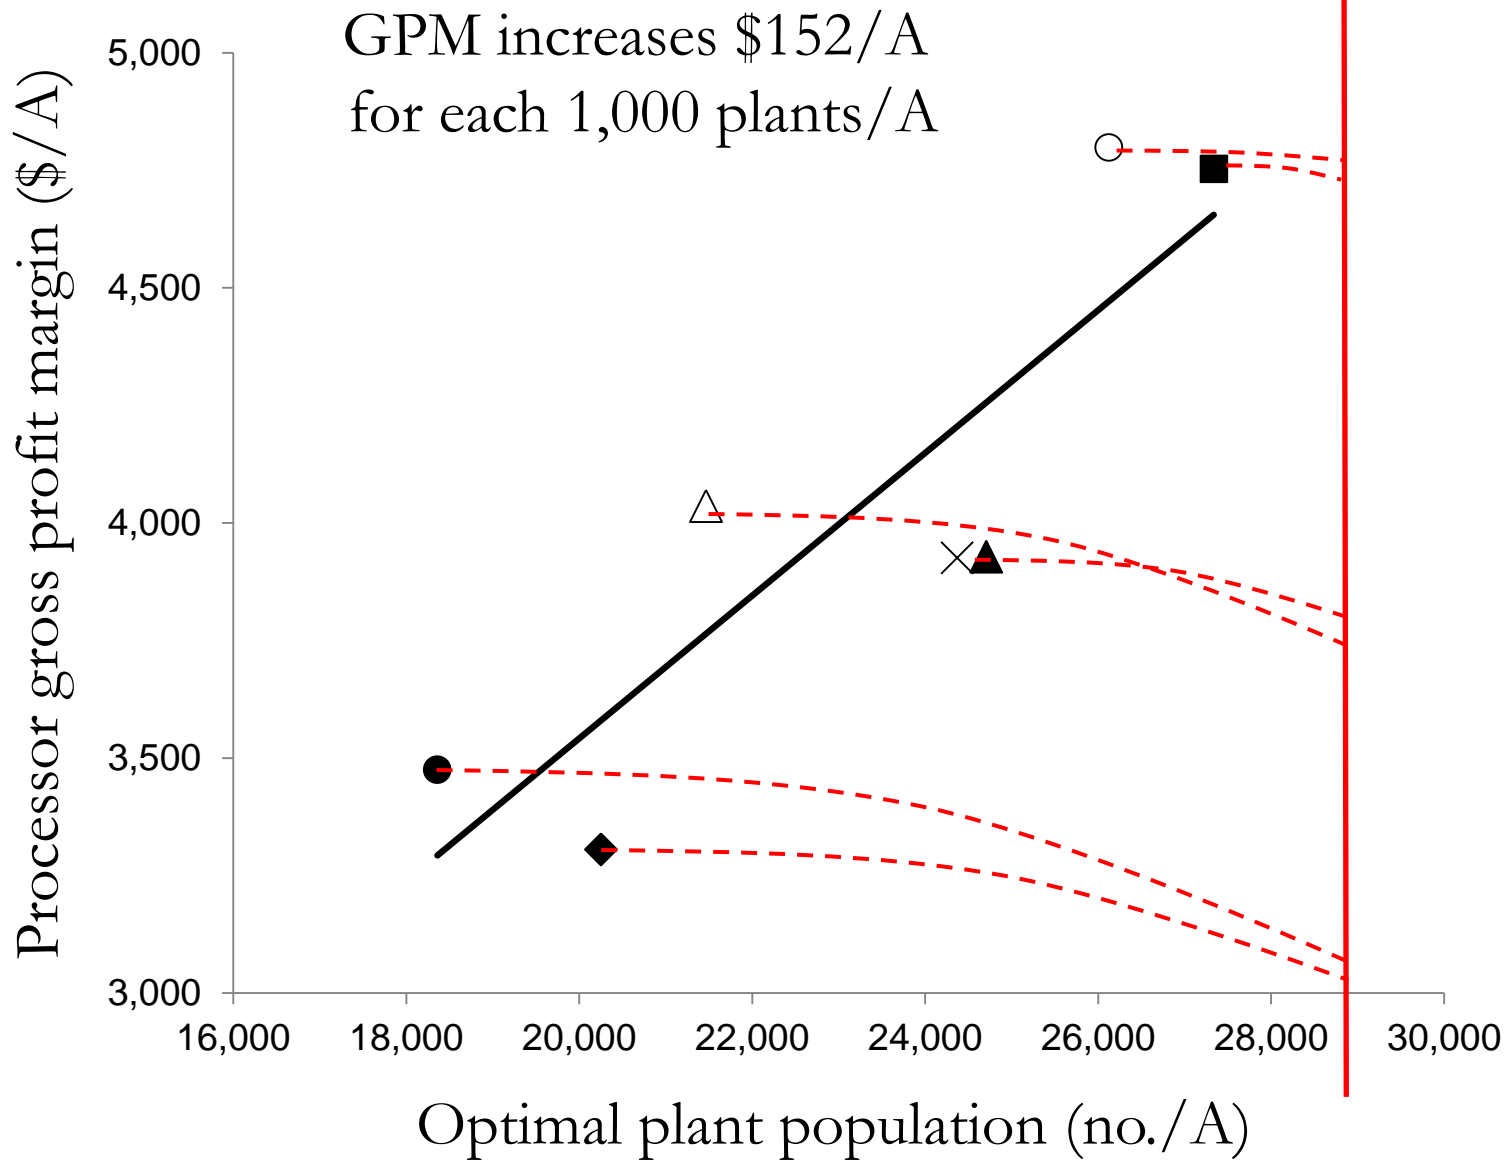

# Objective

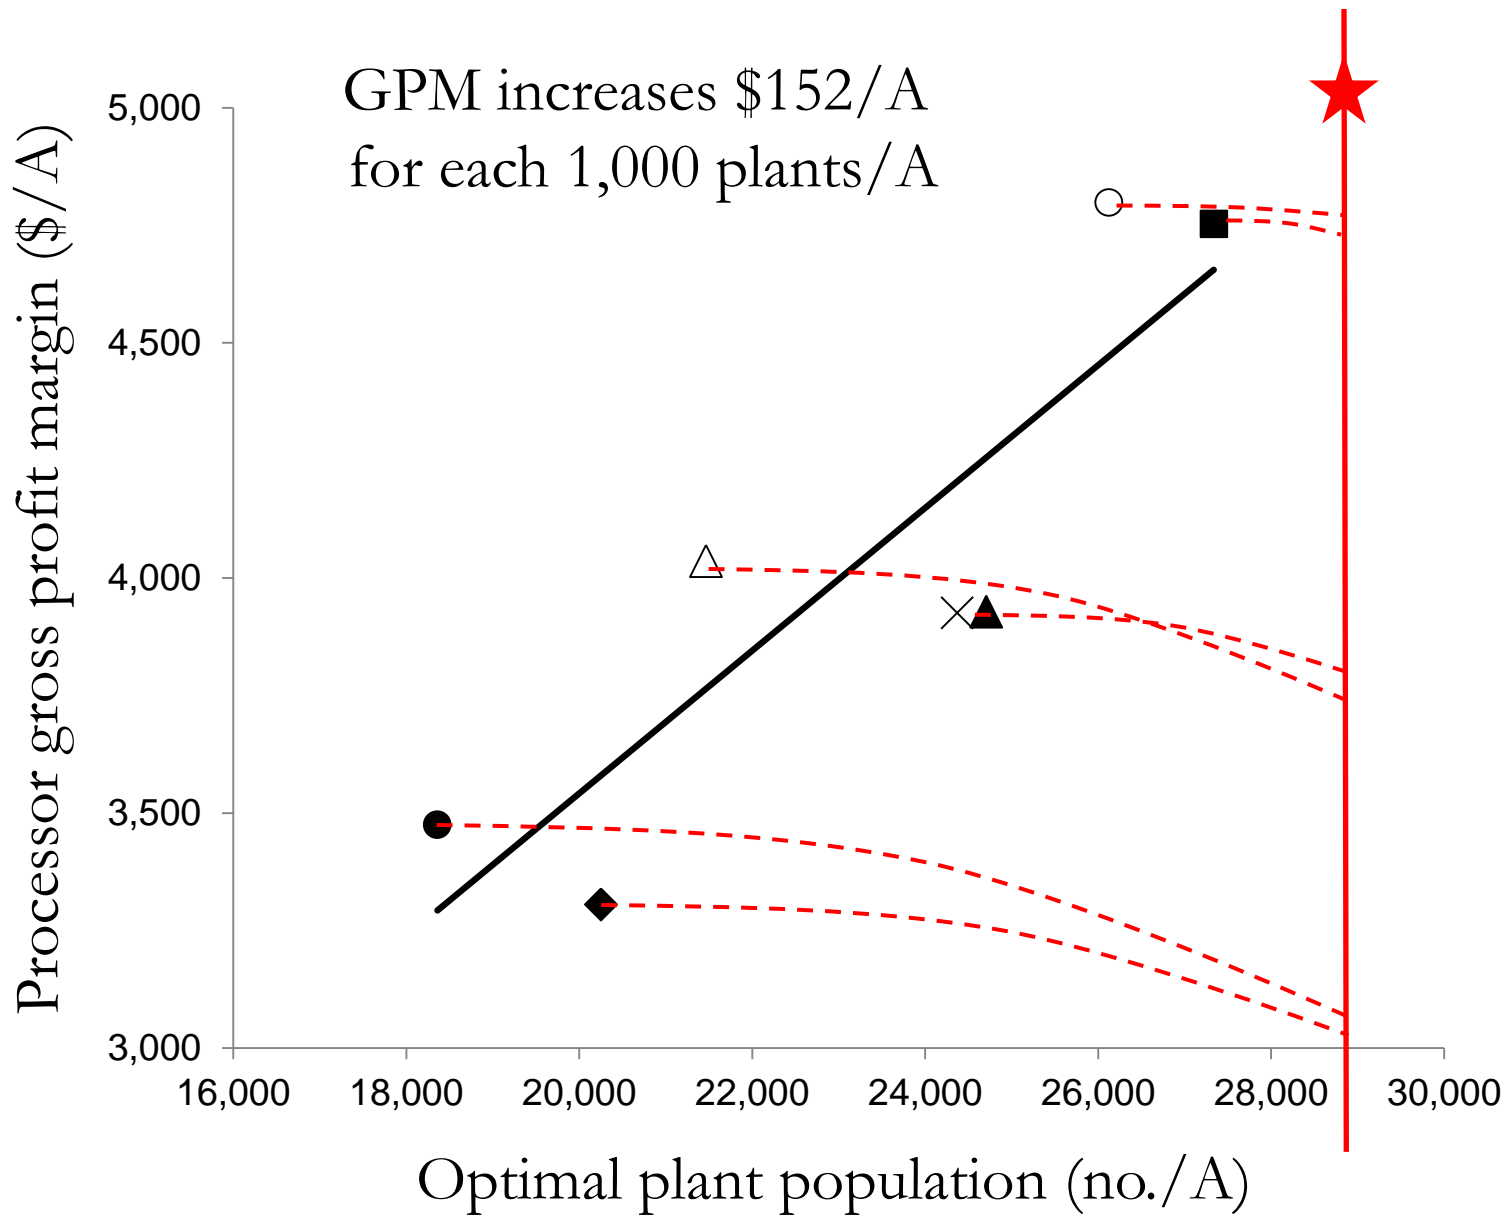

- Compare yield, recovery, and profitability of sh2 processing hybrids
    - tolerance to crowding stress
    - tolerance to nitrogen stress
-

---

# Things this study won't provide:

- Plant population you should use
  - N rate you should apply
  - Other management considerations
  - Your yield – this year or next
  - Election results, winning lottery numbers, etc.
-

---

# Things this trial will provide:

- Through sound, objective science, identify hybrids most tolerant to yield-limiting stresses

# Things this trial will provide:

- Through sound, objective science, identify hybrids most tolerant to yield-limiting stresses

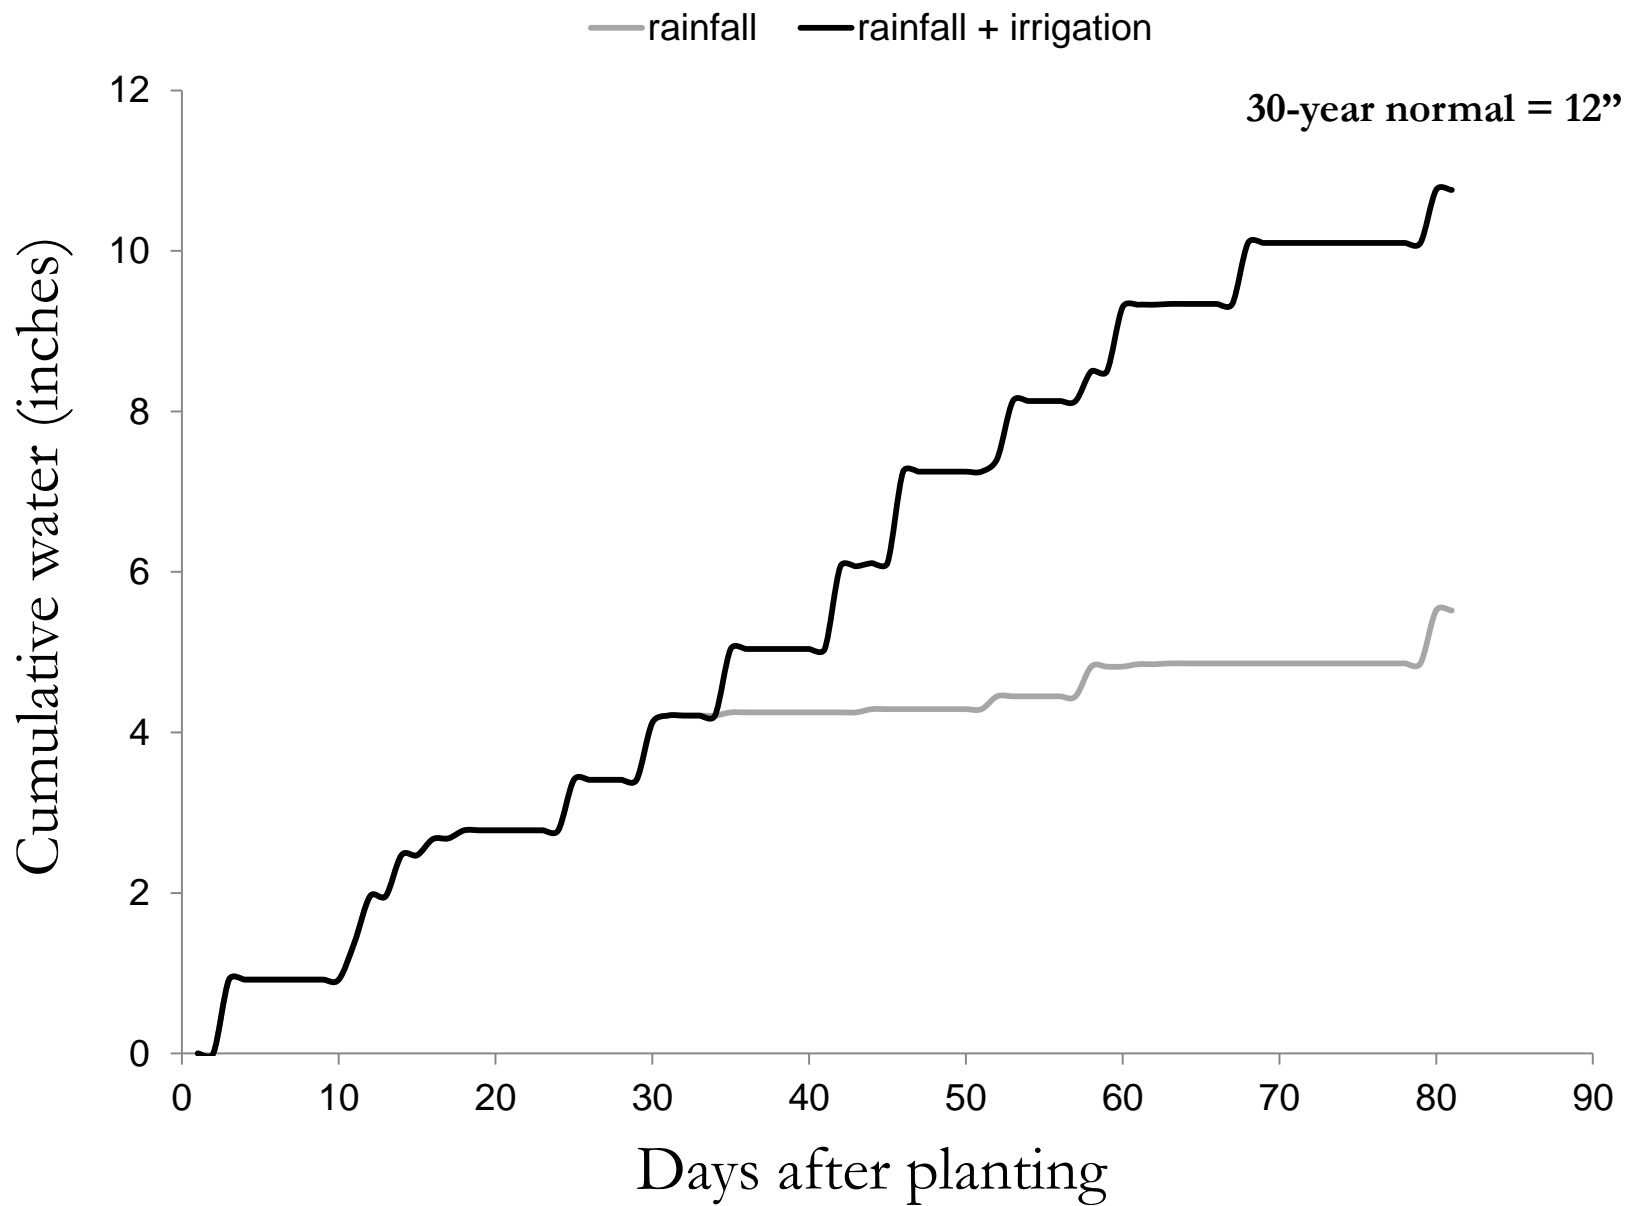

Figure 10-25b Biological Science, 2/e

- 24 entries
- 50% and 150% N rec
- RCBD, 4 reps
- Planted 5/17/12
- 37,000 kernels/A thinned to 29,000 plants/A

# Temperature

Month	Mean temp (F)	Departure from mean (F)	Days>90	Note
May	68.6	+6.1	6	3 days tie/break record
June	72.5	+0.3	9	
July	82.5	+7.5	27	Record no. days above 90 7 days above 100
August	80.5	+7.2	6

---

# Key points

23 hybrids compared at a population that maximizes gross profit margin to processor

All experienced identical conditions

- excellent pest control
- excess nitrogen
- normal water supply
- in a season that was on the hot side

Certain hybrids performed strongly, others did not
